Winter sports are our passion!

The fire burns in our eyes. Not just because we build sustainable biomass heating systems, but also because we are passionate sports fans. While it was once Anton Hargassner sr. himself who daringly pushed himself off the ski jump beam at a young age, he later kindled this fire for sport in Markus and Anton jr. Hargassner as well. This passion still burns in the Hargassner family today and the values of sport therefore also actively shape Hargassner's corporate culture. The "Hargassner Sport Family" unites this enthusiasm for sports, from youngsters to professionals, and shares it with the international fan community.

If you would like to be kept informed and experience first-hand everything that is going on in the world of the "Hargassner Sport Family", please follow them on their Facebook & Instagram social media channels. **#hargassnerfamily**  

Our corporate values are characterised by harmony between nature and satisfied customers

Hargassner. Since 1984, as a pioneer in automated biomass heating systems, we have endeavoured to stand by our customers as a reliable partner – with trustworthiness from Innviertel. We have now grown into an internationally successful company with a pronounced spirit of innovation.

- ✓ Over **39 years of experience**
- ✓ **170,000 customers** worldwide
- ✓ **75,000 m² company floor space**
- ✓ More than **1,200 employees** at several locations
- ✓ **Export to 43 countries**
- ✓ **International awards**

Heating with Wood chips

Advantages

- ✓ **Independent of oil and gas**
- ✓ **Crisis-resistant**, because locally sourced
- ✓ **Short transportation**
- ✓ **Value creation process in the region**
- ✓ **Maximum convenience**
- ✓ **Waste wood utilisation**

Environmentally friendly. Wood chips are CO₂-neutral. In general, the cleaner combustion results in a CO₂ reduction of 95% compared to heating oil.

Local. Using wood chips offers a future-proof market for local companies and secure jobs in the region.

Economical. The combination of low fuel costs and highly efficient combustion makes heating with wood chips so economical.

Future-proof. Since more wood has been growing back in Germany and Austria for decades than has been used, there are sufficient reserves for future biomass entrants.

Comfortable & clean.

Today's biomass boilers are highly sophisticated. The wood chips are automatically transported from the storage room to the boiler. The ignition, control, boiler cleaning and de-ash processes are performed by the system itself. The control of heat distribution also works fully automatically and conveniently.

FACTS

Standards: EN ISO 17225-4, ÖNORM 7133

Calorific value: 4 kWh/kg at 25% water content

Density: 200 - 250 kg/m³

Size of wood chips P16S (corresponds to G30):

Coarse particles (<6%): max. 45 mm long, max. 20 mm Ø

Main particles (>60%): 3.15 - 16 mm long

Fine particles (<15%): max. 3.15 mm long

Size of wood chips P31S (corresponds to G50):

Coarse particles (<6%): max. 150 mm long, max. 40 mm Ø

Main particles (>60%): 3.15 - 31.5 mm long

Fine particles (<10%): max. 3.15 mm long

Water content: 10% - 35% (A1, A2, B1)

Primary energy effort: < 2.0% (for production)

Wood chips production directly on site

Energy prices per year*

Comparing the costs of individual fuels down into cents/kWh reveals an astonishing picture:

Long-term heating cost comparison for biomass - oil/natural gas

In the ten years since 2012, pellets have been 44% cheaper and wood chips 60% cheaper than heating oil on average. Even during the price changes due to global effects in 2022, biomass played to their strength and remains the cheapest convenient fuel.

* Basis: Reference value is the calorific value 15,000 kWh gas, 3500 kWh electricity excluding new customer discount (1000 kWh electricity), 1000 litres heating oil (1000 litres heating oil), 1000 litres heating oil (1000 litres heating oil) (at rate) for 1,000 litres of extra light heating oil free domicile (based on a delivery quantity of 3,000 litres). Source: proPellets, Landwirtschaftskammer Österreich, E-Control, IWO, Österreichische Biomasseverband. Last updated: 24 April 2023

The variety of our wood chip boilers

ECO HK

20–60 kW

Perfect for:

- Detached houses
- Semi-detached houses
- Agriculture

For details, see p. 8

ECO HK

70–120 kW

Perfect for:

- Agriculture
- Public buildings
- Hotels and restaurants

For details, see p. 10

Biomass heating technology at its best

Products from Hargassner combine the highest quality, expertise and decades of proven technology. As a biomass pioneer, Hargassner researches and develops the future of heating with a keen sense of the environment. These innovations make the boilers some of the best biomass heating solutions available in the world today. Lowest emissions at the highest efficiencies, maximum convenience and long lifetime characterise the "Hargassner" brand. Research, quality control and the focus on customer sat-

ECO HK

130 – 230 kW

Perfect for:

isfaction therefore characterise the daily tasks to a high degree. Many customers are already benefiting from this success story. A capacity of more than 30,000 boilers produced per year and over 170,000 satisfied buyers worldwide are proof of the top level of Hargassner heating technology.

Discover the wide world of Hargassner wood chip boilers on the following pages.

Our Eco-HK boiler series from 20 kW to 120 kW have been awarded the Energiegenie (energy genius) innovation prize. You can find more information about our awards and prizes on our website hargassner.com

ECO HK

20 – 60 kW

Hargassner – state-of-the-art wood chip heating technology for the low output range. These boilers are particularly well-suited to farms, detached houses and semi-detached houses.

- ✓ **Cost-cutting** thanks to eco mode
- ✓ **Step grate** special grate system
- ✓ **Automatic fuel quality detection**
- ✓ **Eco-Control** for very low micro-dust levels
- ✓ **Rotary valve in Z-form**
- ✓ **Emergency operation**
with wood logs possible

Application areas

-  Agriculture
-  Detached houses
-  Semi-detached houses

- + — H x W x D = 1,455 x 660 x 940 mm (Eco-HK 20 – 35)
- + — H x W x D = 1,455 x 745 x 1,025 mm (Eco-HK 40 – 60)
- + — Energy efficiency class **A+**
- + — Efficiency of up to 95%
- + — 5-year warranty

All-round convenience

Eco-HK 20–60, side view

- 1 "Step grate" system
- 2 Firebed level control
- 3 Turbulators with autom. boiler cleaning system (also in 1st pass)
- 4 Ash box 30l; optional: ash suction system for very long maintenance intervals
- 5 Automatic ignition with 300W
- 6 Bicameral rotary valve in Z-form (18 cm depth)
- 7 Recirculation integrated as standard
- 8 Heat exchanger: no thermal safety circuit required
- 9 Exhaust fan (EC motor) with negative pressure monitoring
- 10 Integrated back-end protection, optional
- 11 Eco-RA – energy-saving fuel extraction
- 12 Ash extraction system for fly and grate ash
- 13 Negative pressure monitoring
- 14 Fully refractory-lined combustion chamber
- 15 Flame concentration jets made of high-quality refractory
- 16 Lambda sensor
- 17 Stainless steel stoker auger and pipe
- 18 Optional eCleaner micro-dust separator (information on page 21)

ECO HK

70 – 120 kW

Hargassner – state-of-the-art wood chip heating technology for the medium output range. These boilers are particularly well-suited to multi-dwelling buildings, hotels, restaurants and small public buildings.

- ✓ **Cost-cutting** thanks to eco mode
- ✓ **Step grate** special grate system
- ✓ **Automatic fuel quality detection**
- ✓ **Eco-Control** for very low micro-dust levels
- ✓ **Rotary valve in Z-form**
- ✓ **Emergency operation**
with wood logs possible

Application areas

-  Agriculture
-  Public buildings
-  Hotels and restaurants

- ⊕ — H x W x D = 1,670 x 745 x 1,215 mm
- ⊕ — Energy efficiency class **A+**
- ⊕ — Efficiency of up to 95%
- ⊕ — 5-year warranty

Top heating technology solution

Eco-HK 70 – 120

- 1 "Step grate" system
- 2 Firebed level control
- 3 Turbulators with autom. boiler cleaning system (also in 1st pass)
- 4 Ash box 60 l; optional: ash suction system for very long maintenance intervals
- 5 Automatic ignition with 300W
- 6 Bicameral rotary valve in Z-form (18 cm depth)
- 7 Recirculation
- 8 Heat exchanger: no thermal safety circuit necessary
- 9 Exhaust fan (EC motor) with negative pressure monitoring
- 10 Integrated back-end protection, optional
- 11 Eco-RA – energy-saving fuel extraction
- 12 Ash extraction system for fly and grate ash
- 13 Negative pressure monitoring
- 14 Fully refractory-lined combustion chamber
- 15 Flame concentration jets made of high-quality refractory
- 16 Lambda sensor
- 17 Flame temperature monitor
- 18 Stainless steel stoker auger and pipe
- 19 Optional eCleaner micro-dust separator (information on page 21)

ECO HK

130 – 230 kW

Hargassner – state-of-the-art wood chip heating technology for the medium-to-high output range. These boilers are particularly well-suited to public buildings and industrial and commercial enterprises.

- ✓ **Cost-cutting** thanks to eco mode
- ✓ **Step grate** special grate system
- ✓ **Automatic fuel quality detection**
- ✓ **Eco-Control** for very low micro-dust levels
- ✓ **Rotary valve in Z-form**

Application areas

-  Business
-  Public buildings
-  Industry
-  Local heating networks

-  HxWxD = 1,765 x 875 x 1,740 mm (Eco-HK 130 – 170)
-  HxWxD = 1,915 x 945 x 1,905 mm (Eco-HK 200 – 230)
-  Efficiency of up to 95%
-  5-year warranty

Professional performance

Eco-HK 130–230

- 1 "Step grate" system
 - a) De-ash grate
 - b) Stoker grate
 - c) Fixed grate
- 2 Firebed level control
- 3 Turbulators with autom. boiler cleaning system (also in 1st pass)
- 4 Ash box 75 l; optional: ash suction system for very long maintenance intervals
- 5 Automatic ignition with 300 W x2
- 6 Bicaмерal rotary valve in Z-form (22 cm depth)
- 7 Recirculation integrated as standard
- 8 Heat exchanger: no thermal safety circuit necessary
- 9 Exhaust fan (EC motor) with negative pressure monitoring
- 10 Integrated back-end protection, optional
- 11 Eco-RA – energy-saving fuel extraction

- 19** Stainless steel stoker auger and pipe
- 20** Multicyclone with optional eCleaner (information on page 21)

This is what makes it unique

The wood chip boilers from the Eco series are the right choice for all applications that already require a medium to higher heating output. In cascade, i.e. up to six boilers connected in series, an output of up to 2 MW is possible. This is heating technology equipped with many energy-saving extras, so that heat can be produced with reduced emissions and at low cost when energy demands are higher. The "Ecos" stand for effective and efficient heating.

Energy-saving Eco operation

Speed-controlled EC exhaust fan with negative pressure control

Hargassner uses energy-saving EC exhaust fans in its Eco-HK boilers. The crucial advantage of this GreenTech EC technology is the electric speed control, which significantly reduces electricity consumption (up to 80% less electricity). The negative pressure unit constantly measures the pressure conditions in the combustion chamber. The Lambda Touchtronic uses this data to control the speed of the exhaust fan, thus keeping the negative pressure at an ideal level. This concept ensures combustion with the lowest possible emissions and therefore maximum efficiency.

Energy-saving ignition

Thanks to the design of this ignition element, the power consumption has been reduced to just 300 watts (up to 1,000 watts less) and, at the same time, the efficiency of the ignition process has been increased. Two ignition elements are installed in the Eco-HK 130 - 330 series.

Energy-saving fuel extraction system

Thanks to a low drive output of just 0.18 kW (0.25 – 0.55 kW for 70 – 330 kW boilers) and a robust, high-efficiency spur gear, the fuel extraction system saves a huge amount of energy. Savings of up to 67% can be achieved here. With the excellent gear efficiency of over 90%, it clearly outperforms conventional worm gears.

- ✓ Energy savings of over 88%
- ✓ Smart ignition monitoring
- ✓ Silent operation

One boiler – three options

Convenient operation with different fuels

The rotary grates are positioned one behind the other with a "step" between them and can be moved independently of each other. As a result, pellets, various types of wood chips and even agricultural fuels such as miscanthus can be burned easily and conveniently.

Strong **step grate**

Closed grates in the combustion chamber with a high firebed – optimises the **gasification process and minimises micro-dust emissions.**

During the heating cycle, only the **rear rotary grate** is opened during the de-ash process. The ash falls down, the residual embers remain and enable further combustion of the newly extracted fuel.

The combustion chamber is cleaned completely before the boiler is restarted. **Both grates open** (rotate 360 °) and cold ashes and foreign bodies such as stones and nails are disposed of.

For fuel with a very low ash melting point, the rotary grate's special "**breaker function**" will break the clinker.

ECO HK

The future of heating

Fully refractory-lined combustion chamber with standard recirculation

The refractory combustion chamber's special storage effect guarantees high combustion temperatures (even for partial load), minimises the number of times the boiler has to be ignited and reduces emissions.

Every Eco-HK has **flue gas recirculation** integrated as standard to combat ash clinkering caused by dry fuel or fuel with a low ash melting point. The residues can be disposed of via the ash extraction system without any problems, because the cooling of the firebed means that even low ash melting points of low-grade fuels are not yet reached.

Independent firebed monitoring

Non-contact sensors monitor the height of the firebed, so the most efficient combustion condition is achieved.

Lambda sensor control

The **lambda sensor** integrated into the control unit detects the calorific value of the fuel and thus regulates the optimum fuel/air mixture.

Optimised cleaning for high convenience

ALL heat exchanger tubes – including the first pass – are cleaned at regular intervals. The edges of the auger turbulators efficiently remove any fly ash residue from the boiler pipes and this drops straight onto the ash auger. Both the fly ash and the grate ash are transported into a **fully integrated ash box** by just **one** ash extraction auger. The residues are crushed as they are being transported and then compacted in the box, resulting in increased annual efficiency and a higher degree of cleaning convenience. With Eco-HK 20 - 230 kW, only one drive is required for heat exchanger cleaning and ash extraction.

+ — For additional ash transportation systems, see p. 43

Integrated touch control - plug and play

The new **Lambda Touchtronic** meets every need. It is distinguished by an exceptional design and the fact that it is very easy to operate.

- Simple touch menu navigation
- Sophisticated heat distribution
- Automatically adjusts to weather conditions
- Various options for controlling your heating system remotely, ranging from your living room to while you're out (via the app)
- Can be connected to various smart home solutions

For even better
and **clearer air**

PARTIKELFILTER 6 – 230 eCLEANER

Unique filter technology

The filter will significantly reduce your boiler's micro-dust emissions, depending on the quality of the fuel it's running on.

Electrostatic particle charging takes place in the eCleaner. They deposit on the walls and fall down through the automatic cleaning device. An auger moves them to the boiler's ash box.

- ✓ **Low space requirements**
- ✓ **Micro-dust emissions** minimised
- ✓ **Automatic cleaning and transport** into the ash box
- ✓ Optional, easy to retrofit at any time

MULTI ZYKLON Combined with eCleaner

- ✓ **Specially for Eco-HK & Eco-PK 130 – 330**
- ✓ **Total dust** minimised
- ✓ **Accessories: Large ash box**
75 litres or AFS with 240 litres or 300-litre bin

Wood chip cascades

Up to six boilers for a maximum of 2 MW

Due to the special and exact combination of up to six boilers, the power requirement can be optimally adapted to the season. Operational reliability is increased and the fuel storage capacity doubled while also guaranteeing you, the customer, optimal price-performance ratio.

- ✓ **Highest operation safety**
- ✓ **Optimum low-load coverage**
- ✓ **Large extraction volume**
- ✓ **Optimum price-performance ratio**

CHP 60 kW heat & 20 kW power from wood

The Hargassner CHP plant consists of a gasification unit and a generator unit. Based on the principle of wood gasification, this system is used to generate current and heat from natural wood chips. The electrical current generated here is fed into the public grid. The heat that arises is used for heating purposes, drying or similar applications. For more information, see the detailed Hargassner CHP brochure or visit hargassner.com.

Powerful industrial heating systems

Hargassner boilers are designed for continuous high-performance operation. We offer a wide range with systems offering outputs of up to 2,500 kW – in cascade up to 10 MW! The target groups for these boilers range from restaurants and hotels to heating plants, farms and large commercial and industrial businesses. As a customer, you achieve a rapid amortisation of the investment costs through the use of cost-effective wood chips.

- ✓ **Robust industrial design**
- ✓ **Solid radiation vault**
- ✓ **Recycles fuels up to 60% of residual water content**

MAGNO UF

250 – 550 kW

This heating system is characterised by an under feed firing retort (UF) with burnout grate. The boiler is particularly suitable for use in restaurants and hotels, in large commercial and industrial businesses, especially for very dry fuel, and also ideal for joineries and sawmills.

MAGNO VR

250 – 550 kW

The heating system for high output ranges with forward grate firing (VR). This is particularly suitable for wood chips with a high residual water content of up to 60%. High temperatures guarantee clean and efficient combustion. All systems are designed with low-NOx combustion chambers.

MAGNO SR

800 – 2,500 kW, in cascade up to 10 MW

We offer a unique range with systems offering outputs of up to 2,500 kW. These boilers are characterised by a forward grate step grate (SR). A modulating mode of operation as well as efficiencies of over 95.7% enable the highest annual utilisation rates. They are primarily designed for continuous high-performance use and can utilise fuel with a residual water content of up to 60%. Also ideal for local and district heating networks.

SMART HOME & BOILER ACCESSORIES

Control accessories for every need

The Hargassner standard control covers the majority of the requirements in a modern house. However, if further heat circuits, solar collectors, etc. are to be connected, additional boards and remote controls are available. The right solution for every requirement: for more information, visit our homepage or contact your Hargassner installation company.

Heat circuit module HKM: This heat circuit module is used to extend heat and HWT circuits. It is integrated into the control unit of the entire system and controls up to two mixer-controlled heat circuits & one HWT circuit with DHW circulation pump. Additionally, an external heat circuit or an accumulator tank and other HKM's can be connected.

Heat circuit controller HKR with touch: The HKR is a weather-compensated outdoor temperature controller with touch control unit. The controller sends the heating system the information about whether to heat up or not. This way, the room heat can be controlled and kept constant with a maximum of eight heat circuits and five HWT circuits. Among other things, this automatic feature ensures energy-saving heating operation. "Standalone operation" is also possible.

Additional boards: Hargassner offers a wide variety of additional boards for extending heat circuits, etc. **Additional board A/B** are used to add a heat circuit and a hot water tank to a heating system. **Additional board F** is used to control mixed district lines. If up to two additional sensor inputs are required, **additional board PF** is used. Furthermore, there is also **additional board S**, which acts as a differential controller for a solar system in single-circuit or double-circuit operation. Your specialist Hargassner dealer will be happy to explain all other additional boards and their exact use to you.

Remote control via phone or tablet

App for mobile boiler control

The Hargassner app allows you to control the boilers quickly and on the move and view information worldwide around the clock. The app immediately sends important information to the mobile end device via email or push message. This way, you know the status of the boiler at all times. (Requirements: Internet connection to the control unit on the boiler, smartphone with Android or iOS)

Convenient remote controls

You want to change a setting on your boiler or see the current status – without going to your boiler room? No problem! The practical remote controls leave no operating wishes unfulfilled. They are simple, intuitive and boast a design that's perfectly tailored to your needs! Details of our analogue and digital (touch) remote controls can be found on our website hargassner.com

Smart home connections

"Smart home" is an innovative way of controlling the management of energy in your home according to your needs. Hargassner has a connection ready for the most common home automation systems (Loxone, KNX, Mod-Bus, etc.). The benefits are clear. You save energy and costs and enjoy comfort and safety at the same time.

Simple boiler operation

Hargassner has control programmes for all boiler series; these programmes are all clearly arranged and easy to use. They provide a convenient way to control heat circuits and hot water.

Hargassner Lambda Touchtronic

This software controls the Eco-HK boiler series from transport of the fuel and combustion to the heat circuits and hot water tanks. It is guided by weather conditions, so recognises changes in conditions as soon as they occur and seamlessly adjusts the boiler's output accordingly. As a result, the boiler is always running in the optimum output range, enabling you to save both fuel and unnecessary costs.

Everything at a glance

The menu of the Eco-HK series is characterised by its clear structure. More detailed features are available in the boiler-specific operating instructions or from the Hargassner partner commissioning engineer.

Labels and corresponding data points from the boiler control interface:

- Status display of the boiler: KESSEL: Leistungsbrand
- Boiler temperature: 115°C
- Boiler heat output: 100%
- Current accumulator temperature: 64°C
- Customer, commissioning engineer and service settings: Einstellen
- Outdoor temperature: AUSSENTEMP. 4°C
- Heat circuits status: HK1: EIN, HK2: EIN
- HWT temperature: BOILER 1 51°C
- Boiler operating modes: Standard, Rauchfang, Funktion

Lean back and relax – your heating system will do the rest!

Control of heat circuits

The **Lambda Touchtronic** can control multiple heat circuits that are independent of each other. You can specify different settings in detail. For example, you can specify the room temperature you would like on a particular heat circuit at a particular time of day.

Hot water tank

It's only necessary to set the desired hot water tank temperature and loading time. The control unit takes care of the rest. Hargassner guarantees hot water - 24 hours a day.

Another advantage is the automatic HWT priority. This ensures that the room temperature does not cool down during hot water tank loading periods.

Hargassner's **3G day/night reduction mode** makes it possible to set three outdoor temperature thresholds. One mode for "Heating during the day", one for "Reduction during the day" and one for "Reduction during the night". As a result, the boiler only operates if necessary – this is convenient for energy saving. Thanks to the clever residual heat use feature, the energy remaining in the boiler after it has been shut down is efficiently fed into the heat circuits.

Your home therefore remains warm and cosy at all times.

Example of a day heating sequence with reduction logic

Fixed outdoor thresholds above which heating is required: Day from 16°C, night from -5°C (22:00 – 6:00 h)

Heating period 1

06:00 – 09:00: Outside it is -7°C, well below the defined threshold of +16°C. **The boiler switches on.**

Day reduction period

09:00 – 15:00: Outside, the temperature rises to -1°C, which is below the day reduction threshold of +8°C. **The boiler switches on in day reduction mode.**

Heating period 2

15:00 – 22:00: The outside temperature rises to +1°C, which is considerably lower than the threshold of +16°C. **The boiler remains on.**

Night reduction period

22:00 – 06:00: The temperature cools down to -2°C, which is above the night reduction threshold of -5°C. **The boiler switches off.**

protection**

EFFICIENT FUEL EXTRACTION SYSTEM

Eco fuel extraction system from Hargassner: energy-saving and cost-cutting

Unique advantages of the Eco-HK fuel extraction system

Thanks to a low drive output of just 0.18 kW (0.25 – 0.55 kW for 70 – 330 kW boilers) and a robust, high-efficiency spur gear, the fuel extraction system saves a huge amount of energy and therefore lowers electricity costs. You can save as much as 67% in electricity costs compared to those for conventional fuel extraction systems. With the excellent gear efficiency of over 90%, it clearly outperforms conventional worm gears. The new modular design ensures that the auger, along with its trough and removable cover, is easy to use.

- ✓ **Hargassner spur gear**
Lowest friction loss with highest efficiency above 90%
- ✓ **Modular design** planning flexibility
- ✓ **Maximum use of storage space**
due to low installation dimension

- + Very low electricity consumption
- + Quick and easy to install
- + Cost-effective
- + **Sloping floor not needed**

Drive systems compared

ECO HK

Fuel extraction – robust and reliable

1 Two-chamber rotary valve

A Z-shaped rotary valve specially designed for wood chips.

- Chamber depth 18 cm / 22 cm
- For long pieces of wood
- 100% burn-back protection guaranteed
- Easy to replace
- Saves a lot of power
- Has hardened cutting edges

2 Ball coupling

- Flexible tilt and rotation angle
- Maximum planning and installation flexibility

3 Breaker box

- Breaks wood chips that are too long
- Increased operational safety
- With special safety switch

4 Modular design

- Planning flexibility
- Auger extensions of 300 – 2000 mm
- Easy to transport and install
- Quicker and cheaper to maintain
- Individual auger parts can be replaced

Fuel extraction

Eco-HK

- 1 Bicameral rotary valve in Z-form
- 2 Ball coupling
- 3 Breaker box
- 4 FE system extensions (modular design)
- 5 Special spring blade layout
- 6 Effective wood chip inlet bracket
- 7 Extraction auger and shaft
- 8 No-load disc (for FE 450 + 500)
- 9 Eco fuel extraction gear unit (spur gear)
- 10 Stainless steel stoker auger (and pipe) with STM temperature monitoring
- 11 Drive motor for the stoker auger and rotary valve
- 12 Drive motor for the extraction auger and agitator
- 13 Safety cover with a reverse function
- 14 Floor agitator with spring blades
- 15 Maintenance opening
- 16 Fuel storage room - temperature monitoring TMF

+ Sloping floor not needed

5 Special spring blade layout

- Ø of up to 4 m = 3-blade system
- Power-saving gear ratio 1:16
- Ø of 4.5 to 5 m = 4-blade system
- Power-saving gear ratio 1:25
- Ø of 5.5 to 6 m = 3-blade hinged arms
- Power-saving gear ratio 1:25

6 Wood chip inlet bracket

- Optimum fuel supply
- Ideal amount of fuel in the auger shaft
- Max. fuel storage room emptying
- Less effort required and less wear and tear

Solid construction

- Very robust and durable
- Operationally safe
- Maintenance-free

7 New auger and shaft

- Generously dimensioned
- No fuel jams
- Suitable for wood chips/pellets

8 No-load disc

- Disc remains still until the spring blades are retracted under the disc (for FE 450 + 500)
- Effort required halved
- No hollow spaces created

9 Eco fuel extraction gear unit

- Maximum efficiency
- Energy-saving and highly efficient
- Durable

Optimum storage,
a great feeling

TRANSPORT AND STORAGE SYSTEMS

The best solution for every customer scenario

One of the most important aspects of installing a wood chip heating system is planning the fuel storage room. Regardless of whether the storage room is in the house being heated or in an adjacent building and regardless of whether it's in the basement, at ground level or on the first floor, Hargassner has the right solution for every customer requirement. Of course, the storage room should be easy to fill and as big as possible or, as the case may be, as big as necessary. Installing the heating system in an adjacent building can offer some major advantages, because there is more space available and the storage room is also usually easier to fill.

Boiler room and storage room in the basement

Here, the storage room in the basement of the house is filled by a horizontal filling auger on the ceiling with an outside shaft.

Boiler room & storage room in an adjacent building

Here, the storage room (on the first floor) is filled by a vertical filling auger. The extraction is performed by an agitator system with downpipe.

Boiler room and storage room at ground level

In an adjacent building or a boiler house: This type of storage room is filled by the chipper itself or by a tractor with a front loader.

Heating system for a local heating network

Here, the boiler and storage rooms are housed in a completely separate building. The storage room is below ground level and can easily be filled from the top.

Heating modules as a special heating and storage room solution!

Here, the storage room is filled by a vertical filling auger.

STORAGE ROOM SOLUTIONS

Fuel extraction with coordinated concept

Downwards with downpipe

A modular downpipe system developed by Hargassner is used when the wood chip storage room is located on the floor above the boiler. The diameters 150 and 180 cm are available. Various pipe modules and variable extensions ensure precise adjustment towards the stoker auger. Hargassner also has solutions for a vertical offset and concepts with two fuel extraction systems (Y-piece available on request).

Upwards with vertical Connection auger

If wood chips are stored on the floor below the boiler, a vertical, modular auger is used between the fuel extraction system and the boiler to transport the fuel upwards. Here, too, optimally developed modules, extension tubes and solutions ensure precise adjustment towards the stoker auger in the event of a possible offset.

With universal connection auger

The concept with the connection auger is the all-rounder and bridges larger distances with a variable, diagonally mountable transport auger. This as a whole is a module and consists of an extension as well as variable connection heads at the boiler and the augers to each other, which is why almost every building situation can be solved for optimal wood chip transport.

With variable ascending auger

An ascending auger is the perfect concept if the boiler and storage rooms are separated by other rooms (e.g. corridors). For this purpose, the fuel extraction auger is below ground level. An ascending auger in the boiler room then transports the wood chips to the stoker auger of the boiler. Both augers are linear to each other. The ascending auger can be attached to the boiler itself diagonally.

With two fuel extraction systems

This concept makes optimum use of rectangular storage rooms and leads to the boiler with two fuel extraction systems and thus two transport augers. This increases the storage volume and thus also the coverage of the wood chips. The boiler switches between the two fuel extraction systems automatically.

Cascade control for more heating power

Multiple boiler systems with up to six boilers and up to 2 MW

The system concept for the high heating demand allows the heating operation to be optimally adapted to the season through the precise control of up to six boilers in series. The cascade connection also allows a larger capacity of the wood chip storage room to be dimensioned with several agitators. As a result, operational safety is increased.

Double system with one agitator

An agitator directly supplies two boilers controlled from a cascade control. A closed auger with a separate drive turns the agitator in the wood chip storage room. The boilers are supplied with fuel via two open extraction augers.

Distribution box for multiple boiler systems

This is the solution when extraction is only possible from the storage room. The round distribution box has its own drive and adjustable feet. It distributes the wood chips through openings for each boiler and variable connection augers. Up to four boilers can be supplied in this way. An extension is possible with extension frames. It can be used with Hargassner or third-party fuel extraction systems (silo extraction, moving floor extraction, etc.).

STORAGE ROOM FILLING

Automatic storage room refuelling

With ejector inside

A vertical auger inside the storage room transports the wood chips upwards. The filling system's ejector ensures very low dust distribution.

With ejector outside

A vertical auger with shaft transports the wood chips upwards on the outside of the building - ideal for round silos and ground-level rooms with low room heights. The low-dust ejector for distribution is supplied from the outside through a wall opening.

With distribution auger horizontal

A vertical auger for transporting the wood chips upwards is combined with a horizontal distribution auger in the storage room instead of an ejector. Ideal for long wood chip stores and for bridging gaps.

With diagonal auger Variable

Here, a diagonally positioned filling auger with variable inclination and lengths of up to eight metres takes over the filling of the storage room. Ideal for high storage rooms with a gable. It is available with or without a trough.

Example

Automatic filling system (also for storage rooms that are difficult to access) with trough, vertical auger and ejector on the inside

The basic filling trough serves as a filling aid and is located outside the storage room. It is available in lengths of 1.4 m, 2.1 m and 2.8 m (with and without wheels). It can be supplemented with extension frames, side walls and a hinged lid for convenient tipping and can be lowered into the ground if required.

The vertical transport auger is available for heights of up to 8 m and, depending on the quality of the wood chips, achieves a capacity of up to 50 m³/h (horizontal augers are also available in various lengths). The ejector is adjustable for optimum and low-dust wood chip distribution depending on the shape of the storage room. The ejection width depends on the nature and throwing height of the wood chips. The larger and heavier, the further it is distributed (see red curve). Lighter wood chips cannot be thrown as far (black curve). This results in various filling heights.

Automatic filling systems for cellar rooms

With horizontal filling auger (with and without centrifugal disc)

With or without a centrifugal disc, it is the ideal solution for cellar rooms and earth bunkers.

Filling auger for cellar rooms

The horizontal filling auger is an ideal solution for automatic filling of cellar rooms and the distribution of wood chips in earth bunkers. An intermediate bearing is used for stabilisation for free-span filling systems of 5-10 m length. The conveying capacity is up to 30 m³/h (depending on material consistency).

Accessories

As a full-range supplier, Hargassner also offers a comprehensive range of add-ons for "automatic, convenient filling" of the wood chip storage room. Your Hargassner commissioning engineer will also be happy to provide information on site.

Horizontal and vertical extension (max. 8 m)

Angle adaptor

Quick-connect coupling

Transport wheels

Fork lift bracket

Heating modules for outdoors – storage with a system

A heating container with a boiler and integrated wood chip storage room saves an enormous amount of space in the building and generally makes it easier to switch to biomass.

This ideal combination of external boiler and storage rooms comes as a cost-effective system design and as single, double or multiple containers. The modules allow individual lengths, widths, heights and of course different heat outputs. That is why they can be used for detached houses, public buildings, commercial and industrial buildings, and even local heating power plants (heat contracting). They are also very good price-performance ratio.

- ✓ **Set up quickly and easily**
- ✓ **Customised size and design**
- ✓ **Additional storage space**
- ✓ **Easily to expand**

Single floor heating module 35kW wood chips, farm

Single floor heating module 2 x 100kW wood chips, business

HEATING MODULES

Single floor heating module

Double-floor heating module

Modular heating solution – versatile for all applications

A Hargassner heating module can be dimensioned to suit any type of building. Of course, all wishes are open to you in terms of exterior design: whether plain in the standard version with a metal wall or clad to match the house or commercial property. You can find more details at hargassner.com or in our Hargassner heating modules brochure.

Single floor heating module

heating systems from 20–120 kW and 20–32 m³ wood chips

- Apartment buildings
- Hotel, agriculture

Double-floor heating module

heating systems from 70–200 kW and 60–80 m³ wood chips

- Apartment buildings
- Hotels, industry, contracting, etc.

Multiple heating module

heating systems from 140–1,000 kW and 80–160 m³ wood chips

- Apartment buildings
- Hotels, industry, contracting, etc.

Double-floor heating module 200kW wood chips, business

Multiple heating module 660 kW wood chips, industry

Permanently
storing heat

Accumulator systems for storing heat

By storing heat in an accumulator or domestic hot water tank, the boiler does not have to be in operation all the time and can therefore be operated efficiently. Depending on the model, either the heating water alone or heating and domestic water are stored.

Universal heat storage tank Layered accumulator SP for 500–5,000 l

The layered accumulator SP and its solar variant can be used for all Hargassner boilers. The Hargassner partner installation company will be happy to recommend the right solution. The addition of a freshwater station to the models is planned. The heat energy is used efficiently thanks to an integrated return spread sheet and the variable sensor positioning. This saves heating costs in the long run.

- ✓ **Optimised energy utilisation** by a special spread sheet in the accumulator tank
- ✓ **Efficient insulation** with hard casing
- ✓ Suitable for **combination with solar**
- ✓ **Easy and flexible installation**, can be switched in parallel
- ✓ **Very little space required**
- ✓ **Special accumulator sizes** available on request

Layered hygienic accumulator HSP – for 500–1,500 l

By means of the continuous flow principle and a built-in corrugated stainless steel pipe, this accumulator also enables domestic hot water to be heated. The generous size guarantees a high hot water output that is also safe from legionella. The HSP uses the heat energy particularly efficiently thanks to an integrated return spread sheet and variable sensor positioning. This heat storage tank is also available as a solar variant.

- ✓ **Hygienic hot water production**
- ✓ **Optimised energy utilisation** by a special spread sheet in the accumulator tank
- ✓ **Efficient insulation** with hard casing
- ✓ Suitable for **combination with solar**
- ✓ **Easy and flexible installation**, can be switched in parallel
- ✓ **Very little space required**
- ✓ **Calcification protection** through flexible stainless steel corrugated pipe

From flame
to ash

After combustion, dispose quickly & cleanly

The larger the ash bin, the less frequent the maintenance intervals. Hargassner offers various transportation auger systems into a large ash bin. This massively reduces the ash-emptying intervals and improves convenience. A large ash bin means maintenance checks only need to take place once a year.

Ash transportation system (Eco-HK 20-330)

The ash transportation system features a flexible auger and transports the ash into a 240 or 300 litre ash bin. The ash bin can be positioned to the left or to the right of the boiler. The flexible auger can be extended by up to 3 m.

Ash suction system (Eco-HK 20-120)

Hargassner offers an ash suction system for customers who want to have their ash bin outside their boiler room. It enables the 300 l ash bin to be up to 20 m away from the boiler. For outdoor installation, weather protection must be provided by the customer.

Ash-bin

There is a 240 litre ash bin that can be emptied by your refuse collection service and a 300 litre version that has to be emptied by a forklift or a tractor with a front loader.

AC-Ash-Cleaner ash suction device

The Hargassner AC-Ash-Cleaner ash suction device consists of an industrial vacuum unit with a 300 l ash bin on wheels and is used for easy disposal of ash from the ash box or boiler. The filter in the unit can be cleaned semi-automatically when the suction power is reduced. Important: The vacuum cleaner requires weather protection if installed outdoors!

Sunny outlook
for the future

Premium solar collectors

As an ideal complement to biomass heating systems, Hargassner offers high-quality solar panels for the preparation of heating and hot water. They are available as flat-plate collectors with high performance and a long lifetime, and they are available in reinforced versions for regions with high snow loads. The Hargassner Group also markets vacuum flat-plate collectors globally.

Hargassner is the full-range supplier for biomass central heating systems.

Hydraulic components, accessories of all kinds are available extensively and in individual designs for all requirements. Precise coordination of the entire heating solution guarantees optimal cooperation of each individual component with each other. Additional information can be found in further product brochures or on hargassner.com (also as download).

Find out more about our heating accessories at hargassner.com

Versatile heating components

Substation, heat meter, freshwater station & heat circuit groups

Expandable hydraulic components for heat circuits, freshwater preparation, etc. are adapted to the Hargassner boilers. Their control functions are taken over exactly by the Hargassner control system on the boiler.

Stainless steel pipe flue connection set ADO Ø 150 mm

At Hargassner you can also find special stainless steel flue pipe sets for wood chip boilers. The connection sets include all the necessary components such as bows, pipes, boiler collars and seals. There are two versions of these sets, an ADO one with an integrated chimney draught stabiliser (explosive). The Ø 150 mm connection set includes all the bows, pipes, boiler collars and clamp rings.

Back-end protection

This provides automatic back-end protection for Hargassner wood chip boilers while simultaneously loading an accumulator tank. A fully integrated back-end protection that includes a return mixer and highly efficient accumulator loading pump, it can be mounted quickly and easily and reduces installation time and costs.

* The nominal output of these boilers is achieved with the fuel according to standard EN ISO 17225-4, class A1-B1 (P16 S-P31 S, M20) for wood chips and according to standard EN ISO 17225-2 class A1 for pellets. If these fuel specifications or the stated water content levels are not complied with, the respective nominal heat outputs may not be reached. Providing the above fuel-quality requirements are adhered to, the 24 hr constant heat output is approx. 92% of the nominal heat output (e.g. B NO of 220 kW x 92% x 24 hrs = 4752 kWh) ** according to type test with test fuel

HARGASSNER

BIOMASS HEATING TECHNOLOGY

Your expert for **PELLET** | **WOOD LOG** | **WOOD CHIP** BOILERS

Complete Hargassner range: pellet boilers, wood chip boilers, wood log boilers, accumulator tanks, industrial boilers up to 2.5 MW, heating modules, filling augers, combined heat power CHP, Power-Box warm-air module, solar panels and hydraulic accessories
